Abstracts

Continuous boiler blowdown valves are devices used in steam boilers to regulate the removal of impurities and contaminants from the boiler water. They operate by allowing a controlled discharge of water from the boiler, which helps maintain the proper water chemistry, preventing the buildup of scale and corrosion within the system. These valves are typically set to open continuously or at preset intervals, ensuring that the concentration of dissolved solids is kept at an optimal level. By effectively managing the blowdown process, these valves help improve the efficiency, safety, and longevity of the boiler, as well as reduce the need for maintenance.

The global Continuous Boiler Blowdown Valves market size was estimated at USD 568.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
