## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Continuous Electro Deionization System competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Continuous Electro Deionization System is an advanced water purification technology that combines ion exchange resins with electrically active membranes to remove ionized and ionizable species from water continuously, without the need for chemical regeneration. The system operates by applying a direct current across a stack of ion-exchange membranes and resin-filled compartments, which selectively attract and remove dissolved ions from the water stream. CEDI systems are commonly used in industries requiring high-purity water, such as pharmaceuticals, electronics, and power generation. Unlike traditional deionization methods, CEDI offers a more sustainable and cost-effective solution by eliminating the need for chemical regenerants and reducing waste, while maintaining consistent water quality during continuous operation.

The global Continuous Electro Deionization System market size was estimated at USD 1070.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
