Abstracts

Continuous fiber composites testing refers to a series of experimental methods and procedures used to evaluate the properties and performance of continuous fiber - reinforced composite materials. These tests aim to determine various characteristics of the composites, including mechanical properties such as tensile strength, compressive strength, flexural strength, shear strength, and modulus of elasticity; physical properties like density, water absorption, and porosity; and other properties such as thermal stability, fatigue resistance, and fracture toughness. The testing is usually carried out in accordance with relevant standards and specifications, such as those of ASTM, ISO, or other industry - specific standards. Different types of tests are designed to simulate the actual working conditions and loads that the composites may encounter in practical applications, providing important data and references for the design, manufacturing, and quality control of continuous fiber composite materials and their products.

The global Continuous Fiber Composites Testing market size was estimated at USD 589.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
