Abstracts

A continuous flow microreactor is a three-dimensional structural element that can be used for chemical reactions and is made of a solid matrix using special micromachining technology. It contains many tiny channels, and the channel size is usually in the micrometer to millimeter level. In a continuous flow microreactor, the reactants flow through these tiny channels in a continuous flow manner, and chemical reactions occur during the flow process. Due to the small size of the channels and the large specific surface area, rapid mixing of reactants and efficient heat and mass transfer can be achieved, thereby significantly improving the reaction efficiency and selectivity, while also better controlling the reaction conditions and enhancing the safety and controllability of the reaction.

The global Continuous Flow Microreactor market size was estimated at USD 84.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
