Report Overview

Composite Profile Measuring Machine (CCMM) is a measuring device used to detect and measure the surface profile of complex components. CCMM is designed to measure the shape of complex surfaces with high accuracy and repeatability. It uses a probe or scanning device to collect a large number of data points from the surface of the component under test. These data points are then analyzed and processed through specialized software to generate a three-dimensional model of the surface profile. CCMM can programmatically measure various shapes and dimensions, including free form surfaces, curves, radii, angles, and so on. It can also measure the internal and external dimensions of components, making it a universal tool for quality control and inspection. CCMM is particularly useful in applications where traditional measuring tools such as calipers or micrometers are not suitable due to the complexity of the part being measured. It can also save time and reduce costs by automating the measurement process, enabling faster and more efficient inspections.
