#### Report Overview

The Control Rod Drive Mechanism is an electric-stepping, motor-actuated linear drive equipped with a magnetic coupler and a positive feedback potentiometer. A five-phase stepping motor drives a pinion gear and a 10-turn potentiometer via a chain and pulley gear mechanism. The pinion gear engages a rack attached to the draw tube, housing an electromagnet attached to the lower end. The electromagnet in turn engages an iron armature, which is attached to a connecting rod assembly, which terminates at its lower end in the control rod itself. The electromagnet, armature and the upper portion of the connecting rod are all housed in a tubular barrel that extends below the water line in the reactor pool. The upper portion of this barrel is ventilated to permit unrestricted rod movement in water, whereas the lower portion has graded vent holes to restrict movement and to provide a damping action when the electromagnet is deenergized and the control rod is released from the drive.
