Abstracts

Convective Air Warming System is a device that regulates and maintains body temperature by heating air and using the principle of air flow. This system is often used in the medical field, especially in surgery and emergency treatment to prevent patients from hypothermia. Its working principle is to heat the air to a suitable temperature and blow the heated air evenly to the patient's body surface through a fan to promote heat transfer, thereby effectively maintaining a stable body temperature. The advantage of the Convective Air Warming System is that it can provide heat gently and evenly, and avoid the discomfort or harm caused by direct contact with the heating device. It is often used in anesthesia, intensive care, and neonatal warming, etc., where precise control of body temperature is required.

The global Convective Air Warming System market size was estimated at USD 614.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
