Abstracts

Convective warming systems, also known as forced-air warming devices, are medical equipment designed to prevent and treat perioperative hypothermia by actively delivering warmed air through a disposable blanket directly to a patient's body surface during surgical procedures, recovery, or critical care; these systems typically consist of a portable heating unit with temperature controls, a hose, and a variety of blanket designs tailored for different surgical sites (e.g., full-body, upper-body, or lower-body applications), operating on the principle of convection to maintain normothermia and reduce complications associated with unintended heat loss.

The global Convective Warming System market size was estimated at USD 342.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
