Report Overview

Convex-concave groove perforated ceramic balls are new products further developed on the basis of perforated ceramic balls. It uses the diameter of the sphere as the axis for perforation, and at the same time, grooves are opened on the surface of the sphere to present a convex-concave structure. This special design significantly increases the specific surface area and porosity of the sphere, thus giving it unique physical and chemical properties. The convex-concave groove perforated ceramic balls greatly increase the specific surface area and porosity of the ceramic balls by opening grooves and convex-concave bodies on the surface of the sphere, as well as opening holes inside. This makes the convex-concave groove perforated ceramic balls have higher efficiency and larger capacity in mass transfer, adsorption, catalysis and other processes. The convex-concave groove perforated ceramic balls inherit the high mechanical strength characteristics of ceramic materials, can withstand large pressure and impact loads, and ensure stability and reliability during long-term use. Convex-concave groove perforated ceramic balls are widely used in the petroleum, chemical, natural gas and other industries as catalyst support covering materials, tower fillers, etc. Its unique properties enable better dispersion of materials, improved mass transfer efficiency, and reduced system resistance during the reaction process, thereby improving the performance and economy of the entire process.
