Abstracts

A cooking oil purifier machine is a device used to remove impurities, moisture, and other harmful substances from cooking oil to improve its quality and extend its shelf life. It uses the centrifugal force generated by high-speed rotation to separate different components in the oil. The heavier impurities, moisture and particles are thrown to the outer wall of the separation chamber and flow down along the wall, while the lighter and purer oil continues to rotate and flows to the central outlet. Filter Press Oil Purifier utilizes a filter press to separate impurities from the oil. The oil is pressed through a filter medium, and the impurities are intercepted by the filter while the oil passes through to achieve the purpose of purification. Vacuum Oil Purifier uses a vacuum environment to remove moisture and volatile substances in the oil. Under vacuum conditions, the boiling point of water and some volatile impurities is reduced and they are evaporated and removed from the oil. The demand for cooking oil purifier machines is widespread globally, with significant sales regions including North America, Europe, Asia Pacific, and Latin America. These regions have a high concentration of food processing industries, commercial kitchens, and catering services that rely on cooking oil purification to maintain the quality and safety of their products. The cooking oil purifier machine market is moderately fragmented, with several manufacturers and suppliers competing in the industry. There are both large multinational companies and smaller regional players. The market concentration varies based on the region and market segment. Some manufacturers specialize in specific types of cooking oil purifiers, while others offer a broader range of equipment for oil filtration and purification. Consumers are paying more and more attention to the quality and safety of edible oil, prompting edible oil production companies, catering companies and food processing companies to increase investment in edible oil purification equipment to ensure the quality of oil products. Environmental protection policies require companies to reduce the discharge of oil waste. Edible oil purifiers can purify and recycle oil, reduce pollution to the

environment, and meet environmental protection requirements. The rapid development of industries such as catering and food processing has increased the demand for edible oil, and at the same time has put forward higher requirements for the quality and cost control of edible oil. Edible oil purifiers can help companies improve the quality of oil products, extend the service life of edible oil, and reduce costs. In the future, edible oil purifiers will develop in the direction of intelligence and automation, with functions such as automatic control, fault diagnosis, and remote monitoring to improve the convenience and efficiency of equipment operation. In addition to the basic filtering and purification functions, it will also integrate multiple functions such as deodorization, decolorization, and removal of harmful substances to achieve all-round treatment of edible oil and improve the quality of oil products. In response to the needs of families and small catering venues, a portable edible oil purifier with a smaller size and easier operation is developed to meet the personalized needs of users for edible oil purification. With the continuous changes in market demand and the rapid development of technology, edible oil purifier companies need to continuously innovate technology and upgrade products to meet customers' higher requirements for filtering effect, efficiency, intelligence, etc., which poses a challenge to the company's R&D capabilities and capital investment. There are many brands of edible oil purifiers on the market, and the competition is fierce. Companies need to continuously improve their competitiveness in product quality, price, service, etc. to stand out.

The global Cooking Oil Purifier Machine market size was estimated at USD 516.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
