## Abstracts

A cooled thermal imager is a type of thermal imager that employs cooling technology to reduce the temperature of its detector. By operating in a low-temperature environment, the detector can significantly decrease its own thermal noise, thereby greatly enhancing the thermal imager's ability to detect faint infrared signals. This allows the thermal imager to capture the thermal radiation distribution of target objects more sensitively and accurately, ultimately generating high-quality thermal images.

The global Cooled Thermal Imagers market size was estimated at USD 528.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
