## Abstracts

Cooling interface unit is a device specially designed for heat exchange and cooling processes. It transfers heat and reduces temperature by introducing cooling media (such as water, air, etc.) into the heat exchanger to exchange heat with the medium to be cooled. A cooling interface unit usually consists of a heat exchanger body, a control system, a cooling medium supply system, and connecting pipes. The heat exchanger body is the core component for heat transfer. It uses efficient heat transfer materials and structures to ensure that the cooling medium and the medium to be cooled can fully contact and exchange heat. The control system is responsible for monitoring and regulating the cooling process to ensure that the temperature is controlled within the preset range. Cooling interface units are widely used in various occasions that require cooling and temperature control. For example, in industrial production, it is often used to cool mechanical equipment and reduce process temperatures; in data centers and server rooms, cooling interface units are used to maintain stable operation of equipment and extend service life; in refrigeration and air-conditioning systems, it is one of the key devices for achieving indoor temperature regulation and energy saving.

The global Cooling Interface Units market size was estimated at USD 1335.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
