## Abstracts

Cooling tower antiscalant is a chemical specifically designed to prevent the formation of scale in cooling towers. In industrial production, the circulating water system of cooling towers often contains dissolved minerals and hardness ions, which can deposit on pipelines, heat exchangers, and tower walls under high temperatures and evaporation, forming difficult-to-remove scale. The accumulation of scale can reduce heat exchange efficiency, increase energy consumption, and potentially cause equipment damage. Cooling tower antiscalants effectively prevent the deposition of these minerals and hardness ions through mechanisms such as complexation, dispersion, or precipitation, thereby extending equipment lifespan, improving cooling efficiency, and reducing maintenance costs.

The global Cooling Tower Antiscalant market size was estimated at USD 717.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
