Report Overview:

COPD telehealth involves remote daily collection of vital signs and respiratory symptoms from patients using electronic means. A typical COPD telehealth kit consists of “peripheral devices” to collect the vital signs, such as blood oxygen saturation, connected to an electronic platform, for example a tablet computer or a smart phone. The information is collected and transmitted on daily basis to a team of telehealth practitioners via the internet. An alert-generating software is needed to computerize the process of flagging up patients with impending exacerbations e.g. by using a traffic light system. By examining the transmitted data, patients deemed at high risk will have their care escalated in line with agreed local protocols.

The Global COPD Telemonitoring System Market Size was estimated at USD 233.35 million in 2023 and is projected to reach USD 281.89 million by 2029, exhibiting a CAGR of 3.20% during the forecast period.
