Report Overview

Alloy strips are raw material used in the production of lead frames for packaging of integrated circuits (ICs). They typically consist of a combination of two or more metals, such as copper and nickel, with specific properties required for lead frame fabrication. The most common alloys used for lead frame production are high-strength alloys with good ductility and thermal conductivity, making them suitable for use in high-performance IC packages. Stamping and punching processes are used to cut and form the alloy strips into the desired shapes for lead frame production. Lead frames are typically made from alloys such as phosphor bronze, beryllium copper, and stainless steel. The choice of alloy depends on the specific requirements of the application, such as mechanical strength, resistance to corrosion, and thermal conductivity. The most commonly used alloy for lead frame production is phosphor bronze, due to its good mechanical properties, low cost, and good electrical conductivity.
