Report Overview:

In electrical power distribution, a busbar (also spelled bus bar, or sometimes as buss bar or bussbar, with the term bus being a contraction of the Latin omnibus, 'for all', is a metallic strip or bar (typically copper, brass or aluminium) that conducts electricity within a switchboard, distribution board, substation, battery bank, or other electrical apparatus. Busbar is an electrical conductor that carries large current, especially one that is part of a power distribution system; typically a thick strip, or a tube. Busbars are used to carry substantial electric currents over relatively short distances; their greater surface area (compared to a wire of the same weight) reduces losses due to corona discharge.

The material composition and cross-sectional size of the busbar determine the maximum amount of current that can be safely carried. Busbars can have a cross-sectional area of as little as 10 square millimetres (0.016 sq in), but electrical substations may use metal tubes 50 millimetres (2.0 in) in diameter (20 square millimetres (0.031 sq in)) or more as busbars.

The Global Copper Busbar Market Size was estimated at USD 4713.82 million in 2023 and is projected to reach USD 5308.52 million by 2029, exhibiting a CAGR of 2.00% during the forecast period.
