Abstracts

CCA or Copper Clad Aluminum Cable is composed of copper clad aluminum wires which are made from an aluminum core clad with a thin layer of copper. The copper makes up 10% , 15%, and 40% of the wires volume while the rest composes of aluminum alloy wire. Copper clad aluminum is used practically in high-quality coils where weight is very important. Copper clad aluminum wire incurs a low manufacturing cost and thus yields a higher profit during sales for manufacturers compared to counterparts who sell the actual copper equivalents. One of the main traditional applications of CCA is in communication cables as the central conductor of coaxial cables. CCA is also sometimes used in enamelled magnet wire when low weight is critical (e.g. coils for headphones and aircraft instruments). Due to the skin effect, which means that high frequency signals are mainly transmitted in the surface layers of a conductor, CCA is usually used for carrying high frequency signals. For these applications (e.g. coaxial cable) the higher DC resistance of the aluminium core is not so important. Indeed, in really high capacity, very high frequency coaxial cables signal transmission within the central core of the conductor is so negligible that hollow copper tubes, not solid wires, may be used.

The global Copper Clad Aluminum (CCA) Cables market size was estimated at USD 2032.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
