The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Copper Foil for High-Frequency High-Speed 5G competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of Copper Foil for High-Frequency High-Speed 5G will reach 38k tons, with an average selling price of US\$13.7k per ton. Copper foil for High-frequency high-speed 5G is a key electronic substrate specifically used in high-speed communications and high-frequency signal transmission. It is primarily used in the manufacture of core materials such as high-frequency, high-speed copper clad laminates (CCLs) and printed circuit boards (PCBs). Compared to traditional copper foil, it has lower surface roughness, superior conductivity, and corrosion resistance, effectively reducing insertion loss and transmission delay during signal transmission, ensuring the integrity and stability of high-speed signals. In applications such as 5G base stations, antennas, RF front-ends, servers, and high-speed data centers, high-frequency, high-speed copper foil can support higher transmission rates and wider bandwidth requirements, making it a key material for achieving 5G's high speed, low latency, and large-connectivity performance. At the same time, with the development of 5G, AI, the Internet of Vehicles, and cloud computing, the demand for high-performance copper foil continues to grow, driving technological iteration and industrial upgrading in the direction of ultra-thinness, low profile, and high reliability.

The global Copper Foil for High-Frequency High-Speed 5G market size was estimated at USD 519.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.10% during the forecast period.
