Abstracts

Copper molybdenum ores, commonly known as Cu-Mo ores, are polymetallic mineral deposits in which copper and molybdenum occur together, typically within porphyry-type deposits formed by hydrothermal processes associated with intrusive magmatic activity. These ores are primarily valued for their economic content of copper sulfides (such as chalcopyrite and bornite) and molybdenite (MoS_2), which are recovered through a sequential flotation process that separates molybdenum concentrates from copper concentrates due to their differing hydrophobic properties. The presence of molybdenum often enhances the overall economic viability of copper mining operations, as molybdenum commands a high market price due to its critical role in alloy production, particularly in high-strength steels and superalloys used in construction, automotive, aerospace, and industrial applications. The extraction and processing of these ores require sophisticated metallurgical techniques to efficiently separate and purify the metals, and their economic significance is heavily influenced by global demand trends in infrastructure development, manufacturing, and technological advancement.

The global Copper Molybdenum Ores market size was estimated at USD 256.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
