## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Copper Plating for HDI competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Copper plating for HDI refers to the key process of depositing a layer of conductive copper metal on the inner wall of micro-vias (blind holes, buried holes) and the surface of fine lines on the board when manufacturing high-density interconnected printed circuit boards. Its core purpose is to form a uniform, dense, and highly conductive copper layer on the inner wall of these tiny holes, thereby establishing a reliable electrical connection channel between different conductive layers of the multilayer board. At the same time, it also provides the necessary copper conductor foundation for subsequent pattern transfer and etching to form fine lines. Since the holes of HDI boards are extremely small (usually less than 150 microns, or even tens of microns) and the hole depth ratio is high, the uniformity of copper plating, the integrity of the copper layer coverage in the holes (avoiding voids or gaps), and the physical properties of the copper layer itself (such as ductility and adhesion) are very high, and usually require a combination of chemical copper plating (copper deposition) and electroplating copper processes to achieve.

The global Copper Plating for HDI market size was estimated at USD 126.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
