Abstracts

Copper steel clad plate is a composite material consisting of a layer of copper metallurgically bonded to a steel substrate, combining the high electrical and thermal conductivity of copper with the structural strength, durability, and cost-effectiveness of steel. This material is widely used in applications such as electrical grounding systems, power transmission components, chemical processing equipment, and architectural elements where both conductivity and mechanical integrity are required. The bonding process, often achieved through methods like roll bonding, explosion welding, or hot pressing, ensures a strong, inseparable interface that maintains the distinct properties of each metal while offering advantages such as weight reduction, corrosion resistance in specific environments, and improved performance over homogeneous alternatives.

The global Copper Steel Clad Plate market size was estimated at USD 420.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
