## Abstracts

The Copper Tube Aluminum Fin Heat Exchanger is a high efficiency heat exchange equipment with copper tube as the heat transfer core and aluminum fin as the heat dissipation expansion surface. The core structure is composed of copper tube and aluminum fin through mechanical or welding process composite: copper tube is responsible for conducting heat, using copper's high thermal conductivity to achieve rapid heat transfer; The aluminum fins accelerate the diffusion of heat to the surrounding medium by increasing the heat dissipation area (usually strengthened by corrugations, punch joints, etc.) and enhancing the air disturbance. The device combines the corrosion resistance of copper (suitable for complex fluid environments) with the lightweight and low-cost characteristics of aluminum, while further enhancing the corrosion resistance of aluminum fins through surface treatments such as anodizing.

The global Copper Tube Aluminum Fin Heat Exchanger market size was estimated at USD 1514.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
