Abstracts

Cord Blood Storage refers to the collection, processing, and long-term cryopreservation of umbilical cord blood, which is rich in hematopoietic stem cells. These stem cells have the ability to regenerate blood and immune systems and are used in the treatment of various hematologic and genetic disorders such as leukemia, lymphoma, and thalassemia. Cord blood can be stored privately for potential personal or family use, or donated to public banks for use by unrelated patients. With the advancement of regenerative medicine and cellular therapy, cord blood storage is increasingly seen as a valuable medical resource for future therapeutic applications. The stem cell storage service market is primarily driven by the increasing recognition of stem cells' therapeutic potential and the growing demand for personalized and regenerative medicine. Stem cell storage services offer the option to collect and preserve stem cells from various sources, such as umbilical cord blood, adipose tissue, and dental pulp, for future medical use. The rising prevalence of chronic diseases and the need for novel treatments propel the adoption of stem cell storage, as these cells hold promise for regenerating damaged tissues and organs. However, the market also faces challenges, including ethical considerations related to the commercialization of stem cells and the lack of standardized guidelines for stem cell banking and storage. Ensuring the quality and viability of stored stem cells throughout the storage period is critical, and stringent regulatory oversight is required to address safety concerns and maintain public trust in stem cell storage services.

The global Cord Blood Storage market size was estimated at USD 1698.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
