Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Core-shell Rubber Nanoparticles competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Core-shell rubber (CSR) nanoparticles are a class of engineered polymer particles composed of a rubbery core and a rigid or semi-rigid polymer shell. The core is typically made from soft elastomeric materials such as polybutadiene or silicone rubber, providing impact resistance and elasticity, while the shell is often formed from materials like polymethyl methacrylate (PMMA), styrene-acrylonitrile (SAN), or poly(methyl methacrylate-co-acrylonitrile) to ensure compatibility with various polymer matrices and improve dispersion. These nanoparticles are widely used as toughening agents in thermosets (like epoxy resins) and thermoplastics, where they enhance fracture toughness, impact resistance, and durability without compromising other mechanical or thermal properties. Their nanoscale size (typically 50-500 nm) ensures they remain well-dispersed and do not interfere with processing or transparency in advanced composites and coatings.

The global Core-shell Rubber Nanoparticles market size was estimated at USD 538.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
