Abstracts

Coreless holding furnaces are industrial equipment designed for the melting, holding, and superheating of metals?most commonly aluminum, zinc, and their alloys?using induction heating principles, where an alternating current passes through a water-cooled copper coil to generate an electromagnetic field that induces eddy currents within the metal charge, resulting in efficient and uniform heating without direct contact between the heat source and the molten metal. These furnaces are distinguished by their lack of an iron core in the induction system, which allows for greater flexibility in furnace shape, reduced refractory wear, and easier maintenance, making them particularly suitable for applications requiring frequent alloy changes, precise temperature control, and high energy efficiency in foundries, die-casting operations, and metal recycling facilities.

The global Coreless Holding Furnaces market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
