Abstracts

A corona discharge generator is an electrical device designed to produce a controlled corona discharge—a phenomenon where ionization occurs in a fluid, typically air, surrounding a conductor energized to a high voltage, resulting in a faint glow or audible hiss without a full electrical arc. These generators operate by applying a high voltage, often through sharp points or thin wires, to create a non-thermal plasma used in applications such as air purification, static elimination, surface treatment, ozone generation, and electrostatic precipitation. The technology leverages the ionization of gas molecules to neutralize particles, alter material surfaces, or generate reactive species, making it valuable across industrial, environmental, and research sectors where precise, low-energy plasma processes are required.

The global Corona Discharge Generators market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
