Abstracts

Corona treatment is a technology that uses a high-frequency, high-voltage electric field to shock the surface of plastic film to increase the surface energy (surface tension) of the film and enhance its adhesion to inks, coatings and adhesives. This process does not significantly change the physical properties of the film and is an important step in the cooling and winding process of the blown film. By destroying the chemical bonds of the plastic molecules and generating polar groups (such as hydroxyl and carbonyl) on their surface, the surface wettability and bonding properties are improved.

The global Corona Treatment on Blown Film Lines market size was estimated at USD 3127.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
