Report Overview

In the simplest terms, Corrosion Under Insulation (CUI) is any type of corrosion that occurs due to moisture present on the external surface of insulated equipment. The damage/attack can be caused by one of multiple factors, and can occur in equipment operating at ambient, low, and heated services, depending upon conditions. Moreover, CUI can occur on thermally insulated equipment that is in service, out of service, or in cyclic service. Because these surfaces are not generally available/accessible for visual examination, the onset of corrosion cannot be easily identified, and in extreme cases, severe corrosion with consequential loss of system integrity can occur.

The global Corrosion Under Insulation (CUI) Monitoring Equipment market size was estimated at USD 92 million in 2023 and is projected to reach USD 154.12 million by 2032, exhibiting a CAGR of 5.90% during the forecast period.
