Report Overview

Trehalose is a kind of the natural sugars, present in many desert plants, formed in the layer of a glassy matrix, to protect its internal structure until the rain came. Trehalose is a nonreducing sugar formed from two glucose units joined by a 1-1 alpha bond. The bonding makes trehalose very resistant to acid hydrolysis, and therefore is stable in solution at high temperatures, even under acidic conditions. The bonding keeps nonreducing sugars in closed-ring form, such that the aldehyde or ketone end groups do not bind to the lysine or arginine residues of proteins.
