Abstracts

Cotinine screening devices are diagnostic tools designed to detect the presence of cotinine, a metabolite of nicotine, in biological samples?most commonly urine, saliva, or blood?to objectively assess recent tobacco exposure or use. These devices range from rapid, qualitative point-of-care test strips and cassettes used in workplaces, insurance assessments, or smoking cessation programs to more advanced laboratory-based quantitative assays that deliver precise measurements for clinical or forensic applications. The operating principle generally relies on immunoassay technology, utilizing antibodies that specifically bind to cotinine to produce a detectable signal, thereby providing an efficient and non-invasive means of verifying smoking status or compliance with no-smoking policies.

The global Cotinine Screening Devices market size was estimated at USD 850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
