Report Overview

Gasifiers are essentially chemical reactors which are used for the production of heat, rather than fuel for internal combustion engines. An essential advantage of a gasifier is its ability to produce higher temperatures as compared with other conventional methods. Applications of gasifiers are found in forestry and agro-based industries as well as in power supply to remote communities. In updraft gasifiers (also known as counter-current), air enters from below the grate and flows upwards, whereas the fuel flows downwards. An updraft gasifier has distinctly defined zones for partial combustion, reduction, pyrolysis, and drying.
