## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Counter IED competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Counter IED include a variety of sensors and devices designed to find IEDs before they are detonated. For example, metal detectors can identify the metal components of an IED, while chemical sensors can detect the presence of explosive materials. Some advanced detection systems use ground - penetrating radar to look for buried IEDs or thermal imaging to detect anomalies in the environment that might indicate the presence of an explosive device. Radio - frequency jammers are often used to disrupt the communication signals that are used to trigger IEDs. Many IEDs are remotely detonated using radio - controlled mechanisms, and jammers can prevent the detonation signal from reaching the device. Once an IED is detected, specialized tools are used to neutralize or disrupt it. This can include robotic systems that can approach the IED and either disable it or move it to a safe location for disposal. Explosive ordnance disposal (EOD) teams also use various techniques such as water cannons or shaped charges to safely detonate the IED in a controlled manner.

The global Counter IED market size was estimated at USD 1582.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
