Abstracts

The Coupling Beam Damper is named after the location where it is typically installed on the connecting beams of a building. Coupling beams are beams that connect shear walls in buildings. Under dynamic loads such as earthquakes, coupling beams can coordinate the deformation between shear walls. The continuous beam damper utilizes its own mechanical properties, such as viscosity, elasticity, or friction, to dissipate seismic energy and reduce the seismic response of the structure.

The global Coupling Beam Damper market size was estimated at USD 73.8 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.80% during the forecast period.
