## Abstracts

Covalent organic frameworks (COFs) are an emerging class of functional nanostructures with intriguing properties, due to their unprecedented combination of high crystallinity, tunable pore size, large surface area, and unique molecular architecture. Covalent organic frameworks are 2D or 3D organic solids. We can abbreviate them as COFs. These material have extended structures with building blocks which are bonded to each other via covalent chemical bonds. These linkages are strong covalent bonds. Usually, COFs are porous and crystalline structures. Moreover, these materials are made of light elements; mainly hydrogen (H), boron (B), carbon (C), nitrogen (N), and oxygen (O). These light chemical elements usually form strong covalent bonds. Some common examples of covalent organic framework include diamond, graphite, and boron nitride. Covalent Organic Frameworks have a variety of potential applications: Gas Storage and Separation: COFs can be used for the adsorption and separation of gases (e.g., CO<sub>2</sub>, CH<sub>4</sub>, H<sub>2</sub>) due to their high surface area and tunable pore sizes. Catalysis: COFs can serve as catalysts or supports for catalytic reactions due to their porous structure, which allows for the immobilization of active species. Sensors: Their specific interactions with certain chemicals make COFs suitable for use in sensors for detecting gases, pollutants, or biomolecules. Drug Delivery: COFs can encapsulate drug molecules, allowing for controlled release and targeting in medical applications. Energy Storage: Research is being conducted on the use of COFs in batteries and supercapacitors to enhance energy storage capabilities.

The global Covalent Organic Frameworks market size was estimated at USD 134.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 31.10% during the forecast period.
