Report Overview

COVID-19 testing can identify the SARS-CoV-2 virus and includes methods that detect the presence of virus itself (RT-PCR and isothermal nucleic acid amplification) and those that detect antibodies produced in response to infection. Detection of antibodies (serology) can be used both for diagnosis and population surveillance. Antibody tests show how many people have had the disease, including those whose symptoms were minor or who were asymptomatic. An accurate mortality rate of the disease and the level of herd immunity in the population can be determined from the results of this test. However, the duration and effectiveness of this immune response are still unclear. In the last several months, global consumption market of COVID-19 Antibody Detection Kits industry developed with the average growth rate of 303% during last two months. In 2020, global consumption of COVID-19 Antibody Detection Kits reached 2838 K Unit on April. At the same time, global consumption of COVID-19 Antibody Detection Kits reached 24.64 M Unit on April.
