Abstracts

A COVID-19 antibody test, also known as a serological test, is a blood-based diagnostic tool designed to detect the presence of specific antibodies?IgM and IgG?produced by the immune system in response to a SARS-CoV-2 infection. Unlike molecular tests (e.g., PCR) that identify active viral genetic material, antibody tests serve as retrospective indicators, confirming past exposure or immune response, typically becoming reliable days to weeks after symptom onset or infection. These tests operate on various platforms, including rapid lateral flow assays, enzyme-linked immunosorbent assays (ELISAs), and chemiluminescent immunoassays (CLIAs), with applications ranging from individual seroprevalence studies and vaccination response evaluation to population-level surveillance and convalescent plasma donor screening. Their utility is influenced by factors such as sensitivity, specificity, timing relative to infection, and cross-reactivity with other coronaviruses, making them complementary to?rather than a replacement for?direct viral detection methods in comprehensive COVID-19 management strategies.

The global Covid 19 Antibody Test market size was estimated at USD 1274.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of -8.50% during the forecast period.
