Abstracts

The COVID-19 inactivated vaccine is a type of preventive immunization against SARS-CoV-2 that uses a chemically inactivated, non-replicating version of the virus to stimulate an immune response without causing disease. This traditional vaccine platform, employed in products such as CoronaVac by Sinovac and Covaxin by Bharat Biotech, relies on well-established manufacturing processes similar to those used for polio and hepatitis A vaccines. By introducing inactivated viral particles, the vaccine prompts the body to produce antibodies and activate T-cells, providing protection against COVID-19. Inactivated vaccines are generally characterized by their stability in storage and transportation at standard refrigeration temperatures, making them logistically advantageous for distribution in regions with limited cold chain infrastructure.

The global Covid 19 Inactivated Vaccine market size was estimated at USD 1200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of -8.50% during the forecast period.
