Abstracts

CPO refers to the photoelectric co-packaging that co-packages the optical engine and the switching chip together. Compared with the traditional solution in which the pluggable optical module is inserted into the front panel of the switch, the CPO solution significantly shortens the distance between the switch chip and the optical engine, which reduces loss, and high-speed electrical signals can be transmitted between the two with high quality. At the same time, the integration level is improved and power consumption can be reduced, the overall advantage is significant. The proliferation of data-intensive applications necessitates higher bandwidth and energy-efficient solutions, propelling the adoption of CPO switches. The surge in AI workloads demands low-latency, high-bandwidth interconnects, making CPO technology increasingly relevant. CPO switches offer significant power savings compared to traditional pluggable optics, addressing energy consumption concerns in large-scale data centers. NVIDIA's Photonic Switches: In 2025, NVIDIA announced photonic switches with co-packaged optics, aiming to enhance AI data center connectivity and efficiency. Broadcom's CPO Initiatives: Broadcom is advancing CPO technology to address challenges in AI interconnects, focusing on cost, power, and bandwidth improvements. Despite the promising outlook, widespread CPO adoption faces hurdles: Technological Maturity: CPO technology is still evolving, with ongoing developments needed to enhance performance and integration. Cost Implications: Initial implementation costs are high, potentially slowing adoption rates among data center operators. Industry Collaboration: Standardization and collaborative efforts are essential to address integration challenges and promote widespread adoption.

The global CPO Switch market size was estimated at USD 52.8 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 43.30% during the forecast period.
