## Abstracts

CPP medical composite film is a composite material specially designed for the medical industry, mainly made of polypropylene (CPP) base film and other materials processed through composite technology. This material is widely used in medical packaging, drug packaging, and medical device packaging. CPP composite film is widely used in the packaging of medical devices, especially for disposable instruments such as needles, catheters, surgical knives, etc. These products typically require high levels of sealing, barrier, and transparency to ensure their sterile state. CPP composite film is a composite thin film formed by two or more layers, which must be inseparable like a thin film. This not only involves the adhesive between two films It is also related to the ink film. Adhesives are synthetic products. Most adhesives are two-component polyurethane (PU) adhesives The chemical reaction during the drilling process solidifies the adhesive. The adhesive on the surface of the substrate is mainly a physical process, with only a small part being a chemical process. At this time, the components of the adhesive blend with those in the plastic film and further solidify. If a film has already been printed during the bonding process, the adhesive and ink must meet more requirements. The most basic requirement is that the inner layer before composite should have good adhesion and thorough drying. This is becoming more and more flavorful No solvent residue is allowed in the printed inner film. But solvents or alcohol often remain in the ink connecting material. For this reason, the performance of the adhesive must be able to bind with free radicals (- OH groups). Otherwise, the adhesive and curing agent will undergo a self bonding reaction and lose their intended cat like properties. For example, during the composite process, the film has already been printed with PVB ink, and there are residual isomers in the ink. The chemical group (NCO group) of this salt will react with the free radical OH of alcohol and water. The absence of residue prevents the adhesive from fully reacting. Subsequently, there was a lack of solidification and drilling force. There is a difference between solvent based adhesives and solvent-free drilling

agents such as UV adhesives in drilling agents. Solvent based drilling agents require a drying oven to evaporate the solvent. When using UV adhesive, UV light passes through the film and reaches the adhesive, causing the adhesive to polymerize together. At present, composite film preparation technology is also used in the preparation of some inorganic non-metallic thin films, achieving an improvement in the overall optoelectronic performance.

The global CPP Medical Composite Film market size was estimated at USD 1955.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
