Abstracts

Crane electrification refers to the complete replacement of traditional internal combustion engine power with electric drive systems (such as electric motors, batteries, fuel cells or shore power) to achieve the electrification transformation of crane power supply, operation control and energy management. Its core lies in utilizing the efficient conversion and zero-emission characteristics of electric energy, combined with intelligent control technologies (such as variable frequency speed regulation, energy recovery, and Internet of Things monitoring), so that the crane can significantly reduce energy consumption and pollutant emissions (such as CO₂ and NO_x) during operation, and improve operational precision and quietness. It is suitable for use in scenarios such as ports, construction, and industrial manufacturing that have strict requirements on environmental protection, energy efficiency and automation, and is a key direction for the green and intelligent upgrade of industrial equipment.

The global Crane Electrification market size was estimated at USD 243.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
