## Abstracts

Cranial Electrotherapy Stimulator (CES) devices are medical devices that deliver mild electrical stimulation to the brain via electrodes placed on the scalp. CES devices typically use low-frequency electrical currents, ranging from 0.5 to 500 Hz, to stimulate specific areas of the brain. The stimulation is typically delivered for short durations, usually between 20 to 60 minutes. CES devices are primarily used as non-invasive, drug-free methods to alleviate various psychological and neurological conditions. These devices are believed to work by modulating the brain's electrical activity and promoting relaxation, reducing anxiety, and improving sleep patterns. The electrical stimulation is thought to affect neurotransmitter levels and neural circuits involved in mood regulation and stress response.

The global Cranial Electrotherapy Stimulator (CES) Devices market size was estimated at USD 896.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
