Report Overview

Crazy lace agate (also known as Mexican Agate) is a banded chalcedony (microcrystalline quartz) that's infused with iron and aluminum and is often brightly colored and complexly patterned. This produces the creamy browns, blacks, greys and golds (and occasional pinks or reds) swirled together in this stone.

Agates naturally develop when an empty pocket inside a host rock fills in molecule-by-molecule, layer-by-layer as these microcrystals self-organize to form concentric bands or other patterns. The colors and arrangement of the microcrystals are influenced by changes in pressure, temperature, and mineral content that occur during the formation process.

Unlike other gemstones, each agate is unique. Even slabs cut from the same specimen will vary in color and design.

Agate is a cryptocrystalline variety of silica (SiO₂), chiefly chalcedony, characterised by its fineness of grain and brightness of color. There are gray agate, red agate, blue agate and purple agate, etc. But gray agate or motley agate are cheap and use for wall decorations and dyed agate product. Red and blue agates are high value agate stones. Agate can be designed, carved and processed to various decoration products (hand catenaries, necklaces, pendants, wall decorations and sculptures), grinding balls and mortars with pestle, etc.
