## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Cre mRNA competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Cre mRNA is a synthetic messenger RNA encoding Cre recombinase, an enzyme derived from bacteriophage P1 that catalyzes site-specific recombination between loxP DNA sequences. This mRNA format allows for transient, non-integrating expression of Cre recombinase in cells, enabling precise genetic modifications such as gene activation, deletion, or inversion in both in vitro and in vivo systems. Unlike plasmid or viral delivery, Cre mRNA minimizes the risk of genomic integration, reduces immunogenicity (especially when chemically modified with nucleoside analogs like N1-methylpseudouridine), and provides rapid onset of protein expression. It is widely used in conditional knockout experiments, cell lineage tracing, and temporal gene regulation, particularly in genetically engineered animal models that carry loxP-flanked target genes. Cre mRNA can be delivered directly to cells via electroporation, lipid nanoparticles (LNPs), or other transfection reagents, making it a powerful and versatile tool in gene-editing and functional genomics research.

The global Cre mRNA market size was estimated at USD 226.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Cre mRNA market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
