Report Overview

Crop Micronutrient includes nutrients such as boron, zinc, molybdenum, iron, manganese, etc. Although plants require very little trace elements, their effects on plant growth and development are as important as large amounts of elements. When an agriculture micronutrient is lacking, crop growth and development are significantly affected, yield is reduced, and quality is degraded. On the other hand, too much agriculture micronutrient can poison crops, affecting yield and quality, and even endangering human and animal health in severe cases. With the continuous increase of crop yield and the large-scale application of chemical fertilizers, the application of trace element fertilizers has become increasingly urgent. Among the agriculture micronutrient fertilizers, iron, manganese, zinc, copper sulfate, boric acid, molybdic acid, and monovalent salts thereof are usually used.

The global Crop Micronutrient market size was estimated at USD 9863.30 million in 2023 and is projected to reach USD 20383.83 million by 2032, exhibiting a CAGR of 8.40% during the forecast period.

North America Crop Micronutrient market size was estimated at USD 2953.51 million in 2023, at a CAGR of 7.20% during the forecast period of 2024 through 2032.
