Abstracts

Cross flow cooling towers are heat rejection devices that operate by allowing air to flow horizontally across the downward-falling water, facilitating heat exchange through evaporation; this design typically features a fill material that increases surface area contact between air and water, while the water distribution system utilizes gravity-fed basins or nozzles to evenly disperse water across the fill, resulting in efficient cooling with relatively lower pump head requirements and operational noise compared to counterflow designs, making them particularly suitable for large-scale industrial applications, power plants, and HVAC systems where consistent performance and ease of maintenance are prioritized.

The global Cross Flow Cooling Tower market size was estimated at USD 650.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
