Report Overview

Crossed (Cross) roller guide is a precision linear motion guide component that uses precision rollers in a cross arrangement to carry and guide the linear movement of the load. This special design gives it high rigidity, high precision, and multi-directional load bearing capabilities. The basic structure of the crossed roller guide consists of an inner ring, an outer ring, a cage and rollers: The inner ring usually has a V-shaped or arc-shaped groove to accommodate and guide the rollers. The outer ring is also equipped with intersecting V-shaped grooves, which cooperate with the inner ring to form a rolling channel. The rollers are evenly distributed between the inner and outer rings through the cage, and are arranged crosswise in both the radial and axial directions. The function of the cage is to separate the rollers and ensure that they are evenly distributed and do not collide with each other during operation. Features of crossed roller guides: Small rolling friction, good stability; Large contact area and small elastic deformation; There are many effective moving bodies, and it is easy to realize high rigidity and high load movement; Flexible structure design, convenient installation and use, long life; Low mechanical energy consumption, high precision, fast speed and large carrying capacity.

The global Cross Roller Guides market size was estimated at USD 831 million in 2023 and is projected to reach USD 1427.98 million by 2032, exhibiting a CAGR of 6.20% during the forecast period.
