Abstracts

Crossflow filtration systems are membrane-based separation technologies where the feed stream flows tangentially across the membrane surface, minimizing fouling and allowing continuous operation by sweeping away retained particles or molecules into a concentrated retentate stream while producing a purified permeate. These systems are widely used in industries such as biopharmaceuticals, food and beverage, wastewater treatment, and chemicals for applications like cell harvesting, protein purification, clarification of juices and dairy products, and desalination, offering advantages over dead-end filtration in terms of efficiency, scalability, and longer membrane life due to reduced clogging.

The global Crossflow Filtration System market size was estimated at USD 1120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
