### Report Overview:

Crossflow filtration uses a selective porous membrane that filters a liquid in order to purify, or clarify it. While in dead-end filtration the circulation of the liquid is not perpendicular to the filter (as in cartridges, plate filters, etc), in cross-flow filtration the circulation is parallel to the membrane.

In Crossflow filtration, wine passes tangentially across a membrane with a known permeability. This largely eliminates 'filter-caking' experienced with traditional 'dead-end' filtration methods and means Crossflow is a continuous rather than batch process.

The Global Crossflow Membrane Wine Filtration Market Size was estimated at USD 513.05 million in 2023 and is projected to reach USD 757.09 million by 2029, exhibiting a CAGR of 6.70% during the forecast period.
