Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Crown Caps for Beer Bottle competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A crown cap for a beer bottle is a kind of metal closure, which is also known as a crown cork. It was invented by American mechanical engineer William Painter in 1892. The crown cap has a flat top and a crimped edge with 21 serrated teeth. It is designed to be crimped onto the mouth of a glass beer bottle, and when the capping machine presses down, the corrugated perimeter of the crown cap is squeezed and contracted inward, getting stuck on the flange of the bottle neck to achieve a tight seal. There is a liner inside the cap, which was originally a thin cork disc and is now often made of materials such as PVC or thermoplastic elastomers. This liner can not only maintain good airtightness, preventing the carbon dioxide in the beer from escaping and avoiding the oxidation of the beer, but also prevent the beer from directly contacting the metal cap. The crown cap is a classic packaging for glass - bottled beer, which is widely used due to its low cost and good sealing performance, and it is usually opened with a bottle opener.

The global Crown Caps for Beer Bottle market size was estimated at USD 775.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
