## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Crude Helium competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Crude Helium refers to unrefined helium gas extracted from natural gas reserves, typically containing impurities such as nitrogen, methane, carbon dioxide, and trace hydrocarbons. It is an intermediate product obtained during the initial stages of helium production, where raw natural gas undergoes cryogenic separation or pressure swing adsorption (PSA) to isolate helium from other components. Crude helium generally has a helium concentration ranging from 50% to 90%, depending on the source and extraction process, and requires further purification (e.g., through catalytic oxidation or membrane filtration) to achieve commercial-grade purity (99.99% or higher) for industrial, medical, or technological applications.

The global Crude Helium market size was estimated at USD 3125.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Crude Helium market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
